

Packaging and Imports

Takeaways

package = a group of definitions under the same name

To use a definition

- be in the same package
- or import the package

Best practice – mirror the file structure

Fully qualified name

package objects hold standalone methods/constants

- one per package

Name aliasing at imports

```
// Person.scala  
package org.rtjvm.oop  
  
class Person  
object Person
```

```
import java.sql.{ Date => SqlDate }  
import java.util.{ Date => JavaDate }  
import java.{ util => ju }
```
