Default and Named Arguments

Takeaways

When 99% of time we call a function with the same params:

```scala
def factorial(x: Int, acc: Int = 1): Int = {
  ...
}
```

```scala
val fact10 = factorial(10)
```

the other argument is automatically inserted

Naming parameters

```scala
def greet(name: String = "Superman" age: Int = 10): String =
  s"Hi, I'm $name and I'm $age years old."
```

```scala
greet(age = 5)
greet(name = "Sally", age = 5)
greet(age = 5, name = "dog")
```

Scala rocks
